# On the divisibility of powers of integers 

by Jörg W. Müller

#### Abstract

We examine the residues obtained when powers of integers are divided by the square of the exponent. For a given value $n$ of the exponent, the residues exhibit a striking pattern which is discussed for $\mathrm{n} \leq 16$.

## 1. Introduction

The surprising observation that the fourth power of any integer N is either an exact multiple of 16 or exceeds such a value by one unit, i.e. that (for $k=0,1,2, \ldots$ )

$$
\mathrm{N}^{4}=16 \cdot \mathrm{k}+0 \text { or } 1
$$

naturally leads to the question of whether there exist similar simple relationships for powers in general.

Problems of divisibility are a basic topic in number theory and they have produced a rich literature. It may nevertheless happen that some of the relationships concerning residue classes of powers of natural numbers considered in what follows are new.

Let us have a look at the residues ( $\bmod \mathrm{n}^{2}$ ) of expressions of the type $\mathrm{N}^{\mathrm{n}}$, where both N and $n$ are natural numbers. To illustrate our approach, we first consider the two special cases where the exponents are $n=2$ and $n=3$, before discussing the problem in general.

## 2. Two special cases

For the case $\underline{n}=2$ we choose for $N$ the decomposition

$$
\mathrm{N}=2 \mathrm{k}+\mathrm{r}
$$

where $\mathbf{r}=0$ or 1 .

Since

$$
\mathrm{N}^{2}=4 \mathrm{k}^{2}+4 \mathrm{kr}+\mathrm{r}^{2}
$$

we have

$$
\begin{equation*}
N^{2}=r^{2}=0 \text { or } 1(\bmod 4) . \tag{1}
\end{equation*}
$$

It follows from (1) that for any square $\mathrm{N}^{2}$ we have the relation

$$
\mathrm{N}^{2}=0 \text { or } 1(\bmod 4) .
$$

In the same way, for $\underline{n=3}$ we write

$$
\mathrm{N}=3 \mathrm{k}+\mathrm{r},
$$

with $\mathrm{r}=0, \pm 1$.
It is then clear that

$$
\mathrm{N}^{3}=(3 \mathrm{k}+\mathrm{r})^{3}=27 \mathrm{k}^{3}+27 \mathrm{k}^{2} \mathrm{r}+9 \mathrm{k} \mathrm{r}^{2}+\mathrm{r}^{3},
$$

thus

$$
\begin{equation*}
\mathrm{N}^{3}=\mathrm{r}^{3}=0,1 \text { or }-1(\bmod 9) . \tag{2}
\end{equation*}
$$

Negative residuals are used for convenience and, in particular, to avoid large numbers. Thus

$$
\mathrm{N}=-\alpha(\bmod \mathrm{m})
$$

is always equivalent to

$$
N=m-\alpha(\bmod m) .
$$

## 3. The general case

For the general case, it may be useful to discuss separately the cases of an even or odd power n.
a) For $n$ odd, say $n=2 s+1$, with $s=0,1, \ldots$, we write the integers $N$ in the form

$$
\mathrm{N}=\mathrm{nk}+\mathrm{r},
$$

with $r=0, \pm 1, \pm 2, \ldots, \pm s$.
Then

$$
\begin{aligned}
\mathrm{N}^{\mathrm{n}} & =(\mathrm{nk}+\mathrm{r})^{\mathrm{n}} \\
& =(\mathrm{nk})^{\mathrm{n}}+\mathrm{n}(\mathrm{nk})^{\mathrm{n}-1} \mathrm{r}+\ldots+\mathrm{n}(\mathrm{nk})^{1} \mathrm{r}^{\mathrm{n}-1}+\mathrm{r}^{\mathrm{n}} .
\end{aligned}
$$

By taking this modulo $n^{2}$ we find

$$
\begin{align*}
\mathrm{N}^{\mathrm{n}}= & 0+\mathrm{r}^{\mathrm{n}}\left(\bmod \mathrm{n}^{2}\right) \\
= & \left(0, \pm 1, \pm 2^{\mathrm{n}}, \ldots, \pm \mathrm{s}^{\mathrm{n}}\right)\left(\bmod \mathrm{n}^{2}\right) . \tag{3}
\end{align*}
$$

The possible residues resulting from (3) are listed in Table 1.

Table 1 - The residues occurring in (3), for $n$ odd.

b) For $\underline{n}$ even, say $n=2 s$, the integers $N$ are again written as

$$
N=n k+r
$$

with $r=0, \pm 1, \pm 2, \ldots, \pm(s-1),+s$.
This yields for the power n as before

$$
N^{n}=(n k+r)^{n}=(n k)^{n}+\ldots+r^{n}
$$

thus modulo $\mathrm{n}^{2}$ becomes

$$
\begin{align*}
N^{n}= & r^{n}\left(\bmod n^{2}\right) \\
& =\left(0,1,2^{n}, \ldots, s^{n}\right)\left(\bmod n^{2}\right) \tag{4}
\end{align*}
$$

For even powers $n$ we are led to the residues given in Table 2.
. Table 2 - The residues occurringin (4), for $n$ even.

| n | $\mathrm{r}^{\mathrm{n}}$ |  |  |  |  |  |  | $\mathrm{R}=\mathrm{r}^{\mathrm{n}}\left(\bmod \mathrm{n}^{2}\right)$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | 0 , | 1 |  |  |  |  |  | 0 , | 1 |  |  |  |
| 4 | 0 , | 1 , | $2^{\text {n }}$ |  |  |  |  | 0 , | 1 |  |  |  |
| 6 | 0 , | 1 , | $2^{\text {n }}$ | $3^{n}$ |  |  |  | 0 , | 1, | -8, | 9 |  |
| 8 | 0 , | 1 , | $2^{\text {n }}$ | $3^{\text {n }}$ | $4^{n}$ |  |  | 0 , | 1, | 33 |  |  |
| 10 | 0 , | 1 , | $2^{\text {n }}$ | $3^{\text {n }}$ | $4^{n}$, | $5^{\text {n }}$ |  | 0 , | 1, | 25, | $\pm 24$, | 49 |
| 12 | 0 , | 1 , | $2^{\text {n }}$ | $3^{\text {n }}$ | $4^{\text {n }}$, | $5^{n}$ | $6^{\text {n }}$ | 0 , | 1, | -63, | 64 |  |

From the above it follows that, for $n$ even or $n$ odd, we have the general relation

$$
\begin{equation*}
N^{n}=R\left(\bmod n^{2}\right), \tag{5}
\end{equation*}
$$

with the values of R given (for $\mathrm{n} \leq 12$ ) in Tables 1 and 2 .

## 4. Some complements

For a more detailed insight, the residues R do not only have to be known globally for a given exponent n, as presented in Tables 1 and 2, but their association with the specific values of $N$ must also be given. Since the residues $R$ have a particular structure with period $n$, it is sufficient to list them for the $n$ possible values of $m=N(\bmod n)$. This has been done in Table 3 (for $\mathrm{n} \leq 16$ ).

Table 3 - List of the residues $R=R(n, m)$ for the powers $N^{n}$, with $N=m(\bmod n)$.
Values not listed for $m$ are zero.

|  | $\mathrm{m}=1$ | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 |
| :---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $\mathrm{n}=2$ | 1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 3 | 1 | -1 |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 4 | 1 | 0 | 1 |  |  |  |  |  |  |  |  |  |  |  |  |
| 5 | 1 | 7 | -7 | -1 |  |  |  |  |  |  |  |  |  |  |  |
| 6 | 1 | -8 | 9 | -8 | 1 |  |  |  |  |  |  |  |  |  |  |
| 7 | 1 | -19 | -18 | 18 | 19 | -1 |  |  |  |  |  |  |  |  |  |
| 8 | 1 | 0 | 33 | 0 | 33 | 0 | 1 |  |  |  |  |  |  |  |  |
| 9 | 1 | 26 | 0 | 28 | -28 | 0 | -26 | -1 |  |  |  |  |  |  |  |
| 10 | 1 | 24 | 49 | -24 | 25 | -24 | 49 | 24 | 1 |  |  |  |  |  |  |
| 11 | 1 | -9 | 3 | -40 | 27 | -27 | 40 | -3 | 9 | -1 |  |  |  |  |  |
| 12 | 1 | 64 | -63 | 64 | 1 | 0 | 1 | 64 | -63 | 64 | 1 |  |  |  |  |
| 13 | 1. | 80 | -23 | -22 | 70 | -19 | -49 | $=-70$ | 22 | 23 | -80 | -1 |  |  |  |
| 14 | 1 | -80 | -19 | -68 | -31 | -48 | 49 | -48 | -31 | -68 | -19 | -80 | 1 |  |  |
| 15 | 1 | -82 | -18 | -26 | -100 | -99 | -107 | 107 | 99 | 100 | 26 | 18 | 82 | -1 |  |
| 16 | 1 | 0 | 65 | 0 | -63 | 0 | 129 | 0 | 129 | 0 | -63 | 0 | 65 | 0 | 1 |

A closer look at this tabulation reveals some interesting symmetries. Thus, it is readily seen that

$$
\begin{array}{ll}
R(n, m)=R(n, n-m), & \text { for } n \text { even, and } \\
R(n, m)=-R(n, n-m), & \text { for } n \text { odd, } \tag{6}
\end{array}
$$

with $\mathrm{m} \leq \mathrm{n} / 2$.

Exact divisibility ( $R=0$ ) occurs only for exponents $n$ which are of the form

$$
\begin{equation*}
\mathrm{n}=\mathrm{ch}^{2} \tag{7}
\end{equation*}
$$

where $\mathrm{c} \geq 1$ and $\mathrm{h} \geq 2$.
Then $R\left(n, m_{0}\right)=0$ if $m_{0}$ is a multiple of $c h$ (below $n$ ).
This may be illustrated by the following examples:

$$
\begin{array}{ll}
\text { If } n=8=1 \cdot 2^{3}, & \text { then } m_{0}=2,2 \cdot 2 \text { or } 3 \cdot 2 ; \\
\text { if } n=9=1 \cdot 3^{2}, & \text { then } m_{0}=3 \text { or } 2 \cdot 3 ; \\
\text { if } n=12=3 \cdot 2^{2}, & \text { then } m_{0}=3 \cdot 2 .
\end{array}
$$

However, many other features of Table 3 remain mysterious, such as the occurrence of the sequences $-8,9,-8$ (for $n=6$ ), $-24,25,-24$ (for $n=10$ ) or $64,-63,64$ (for $n=12$ ).

In addition, many of the equivalences given above can apparently be simplified. Thus, for $n=2,3$ and 4 we have, for example, the relations

$$
\begin{align*}
\mathrm{N}^{2}(\bmod 4) & =\mathrm{N}^{2}(\bmod 2) \\
\mathrm{N}^{3}(\bmod 9) & =\mathrm{N}(\bmod 2),  \tag{8}\\
\mathrm{N}^{4}(\bmod 3) & =\mathrm{N}(\bmod 3), \\
& =\mathrm{N}^{4}(\bmod 4)
\end{align*}=\mathrm{N}(\bmod 2), .
$$

if we agree systematically to use negative residues when $r>n / 2$.
The general rules applicable to decompositions similar to (8), however, are not known to the author.
(July 1995)
