

What next with the candela

20th Meeting of the NMI Directors

Bureau
♦ **I**nternational des
♦ **P**oids et
♦ **M**esures

- Introduction of defining constant for photometry, K_{cd}
luminous efficacy of monochromatic radiation of frequency 540×10^{12} Hz
- Reformulation of definition of the candela
 - (not a redefinition), to bring it in **explicit constant** form:

THE CANDELA

The candela, symbol cd, is the SI unit of luminous intensity in a given direction. It is defined by taking the fixed numerical value of the luminous efficacy of monochromatic radiation of frequency 540×10^{12} Hz, K_{cd} , to be 683 when expressed in the unit lm W^{-1} , which is equal to cd sr W^{-1} , or $\text{cd sr kg}^{-1} \text{m}^{-2} \text{s}^3$, where the kilogram, metre and second are defined in terms of h , c and $\Delta\nu_{\text{Cs}}$.

The luminous efficacy of monochromatic radiation of frequency 540×10^{12} Hz, K_{cd} , is 683 lm/W.

- K_{cd} makes a direct link between photometric and radiometric quantities for monochromatic radiation of frequency 540 THz

flux

$$\text{lm} \leftrightarrow \text{W} \\ K_{cd}$$

illuminance

$$\text{lx} \leftrightarrow \text{W} \cdot \text{m}^{-2} \\ K_{cd}$$

intensity

$$\text{cd} \leftrightarrow \text{W} \cdot \text{sr}^{-1} \\ K_{cd}$$

luminance

$$\text{cd} \cdot \text{m}^{-2} \leftrightarrow \text{W} \cdot \text{sr}^{-1} \cdot \text{m}^{-2} \\ K_{cd}$$

Photometry

www.bipm.org

Warhol, *Marilyn Monroe* (1967)

Photometry

Photometry is the science of the measurement of light, in terms of its perceived brightness to the human eye.

To do photometry, you need :

light
stimulus

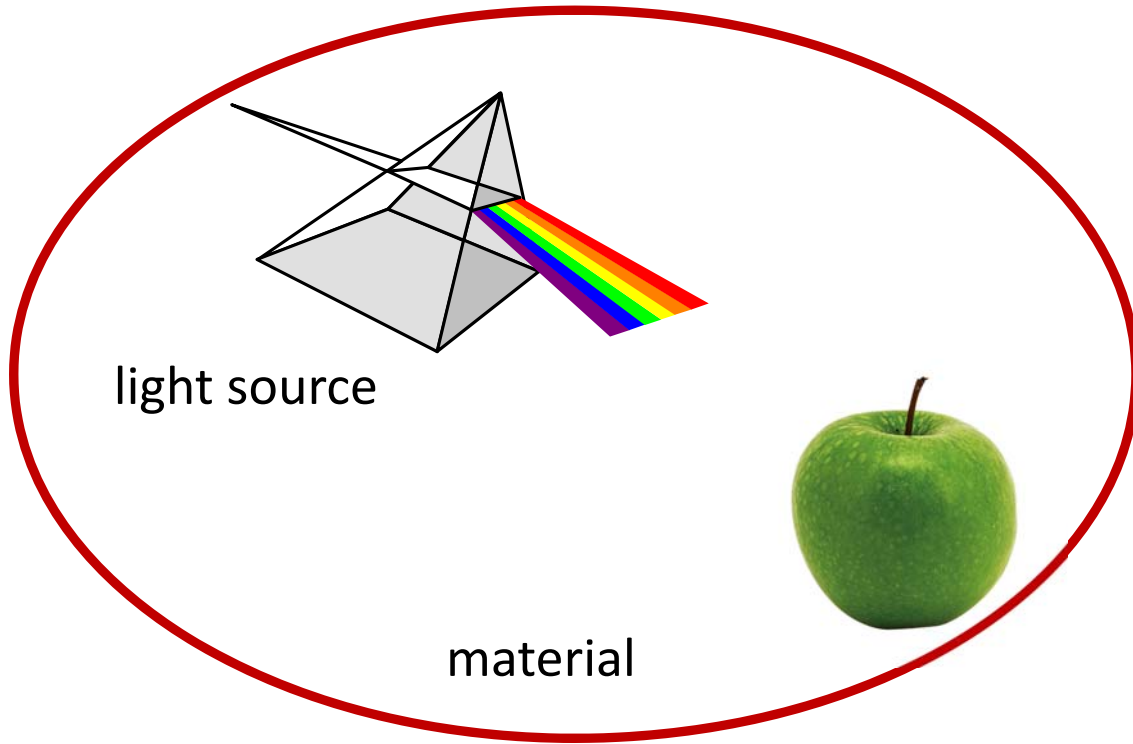

eyes

brain

Photometry

light
stimulus

Measurement of perceptive quantities

Challenge

The measurand is not accessible by the measuring instrument

Object

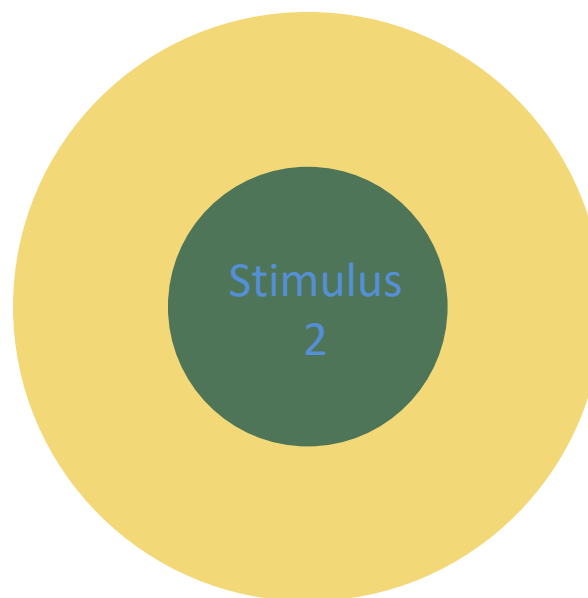

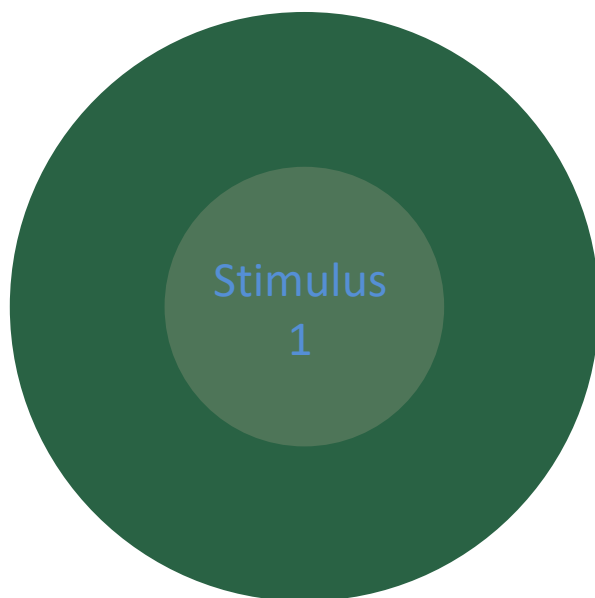

Measurand

Measurement of perceptive quantities

Is stimulus 1 = stimulus 2 ?

Measurement of visual quantities

Photometry deals with visual quantities.

The measurand is not accessible by the measuring instrument

The measurand may vary from an observer to another

Object

Visual quantity

Vision and $V(\lambda)$ curve

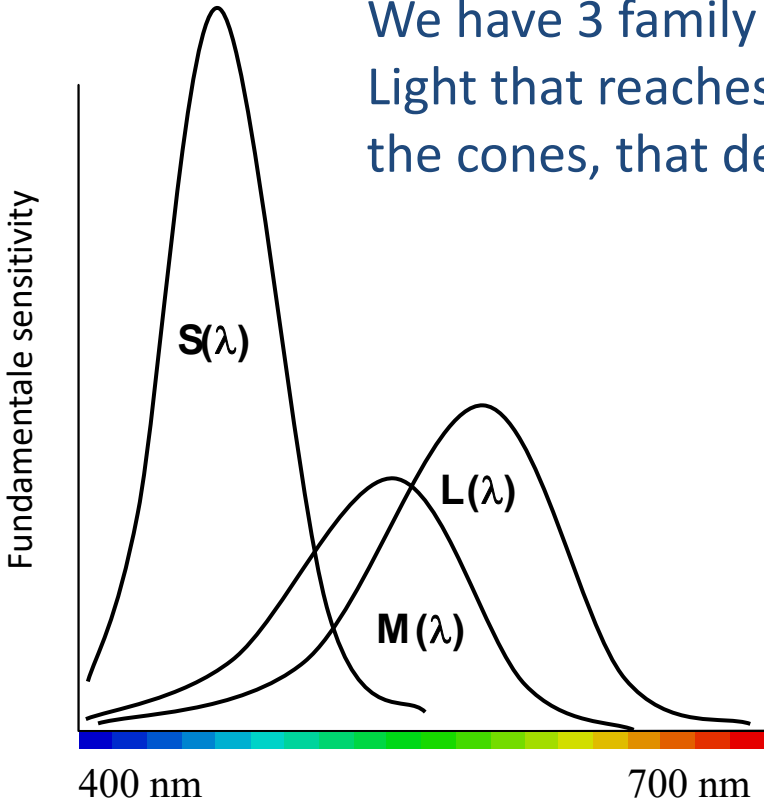

Human eye

Vision and $V(\lambda)$ curve

Cones (L M S)

We have 3 family of cones.
Light that reaches the retina generates 3 signals in the cones, that depend upon the wavelength

- $S(\lambda)$ $\lambda_{\max} \cong 440 \text{ nm}$
- $M(\lambda)$ $\lambda_{\max} \cong 540 \text{ nm}$
- $L(\lambda)$ $\lambda_{\max} \cong 570 \text{ nm}$

Vision and $V(\lambda)$ curve

◆ We don't have the same repartition of cones, but the visual system adjusts the sensitivity by adapting the gain

Individual variations

Hofer, Carroll, Neitz, Neitz, Williams, JNeuroscience 2005

Figure 4. False color images showing the arrangement of L (red), M (green), and S (blue) cones in the retinas of different human subjects. All images are shown to the same scale.

Towards the candela

1900 : the « black body », the ideal standard

Radiance from the black body depends only of its temperature

$$L_{\lambda}(\lambda, T) = \frac{2hc^2}{\lambda^5} \frac{1}{e^{hc/(\lambda kT)} - 1}$$

with :

λ , wavelength of the radiation

T, black body temperature

c, speed of light

h, Planck constant

k, Boltzmann constant

Photo collection particulière D. J. Lovell

Max Planck

Towards the candela

Freezing temperature of Platinum

«The candela is the luminous intensity, in the perpendicular direction, of a surface of 1/600 000 square metre of a black body at the temperature of freezing platinum under a pressure of 101 325 newtons per square metre.»
XIII^{ème} CGPM, 1968

If the freezing platinum temperature varies, the radiation emitted by the black body varies and the candela varies !!

Radiometry, a new way for the candela

Radiometry to rescue photometry

Radiometry is the science of measurement of radiant energy (including light) in terms of absolute power. Radiometric techniques characterize the distribution of the radiant power according to the wavelength.

Radiometry, a new way for the candela

Transformative technology

Invented in 60s in the USSR and the US

Nobel prize to Basov, Prokhorov, Townes

Was recognized as an amazing discovery “from science fiction”

Was thought to be a useless “science toy”: “a solution looking for problem”

From laser to WEB 2.0

- Broad-band data transmission is enabled by fiber-optical communication
- Laser is a key component
- Dramatic impact on modern society in the past decade

Manipulating single photons

Adding a single photon

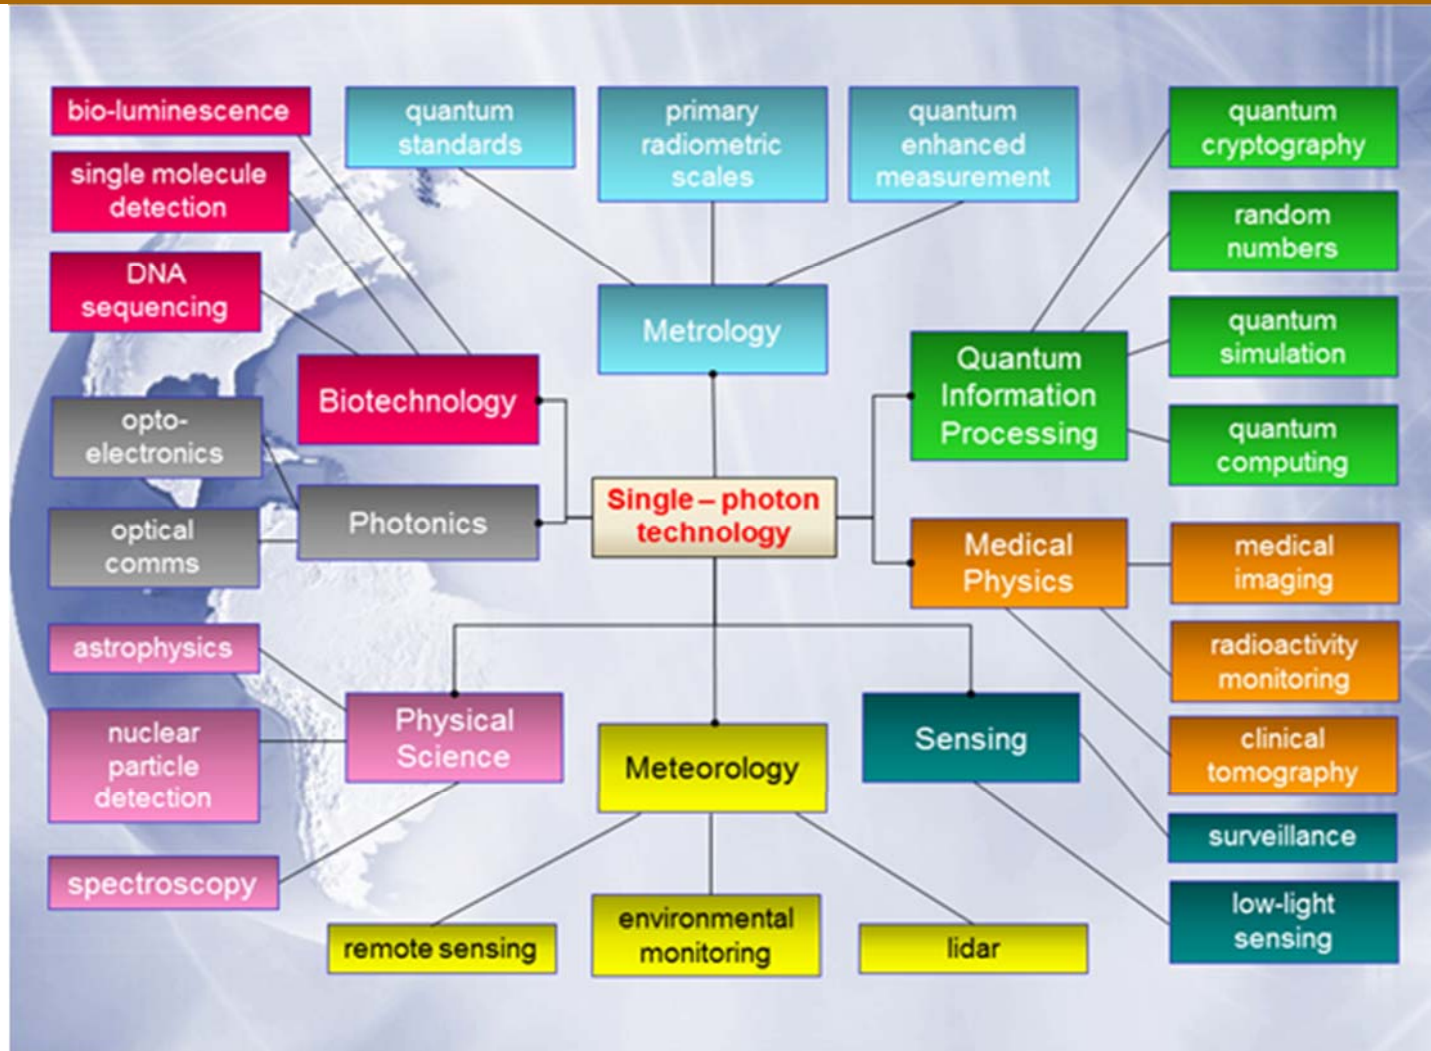

Subtracting a single photon

Time delocalisation of singles photons

Second Quantum Revolution

Light sources

Correlation functions

$g^{(2)}(0)=1$: **random**, no correlation, ex. poissonian (laser) light

$g^{(2)}(0)>1$: **bunching**, photons tend to arrive together, ex.: thermal light

$g^{(2)}(0)<1$: **anti-bunching**, violates classical inequality, ex.: Fock states

Single-Photon Sources for practical quantum applications

- On demand

- ◆ No multiphoton states

- Indistinguishability

Statistical reconstruction of quantum optical states

Coherent state
(attenuated He-Ne laser)

Single photon states

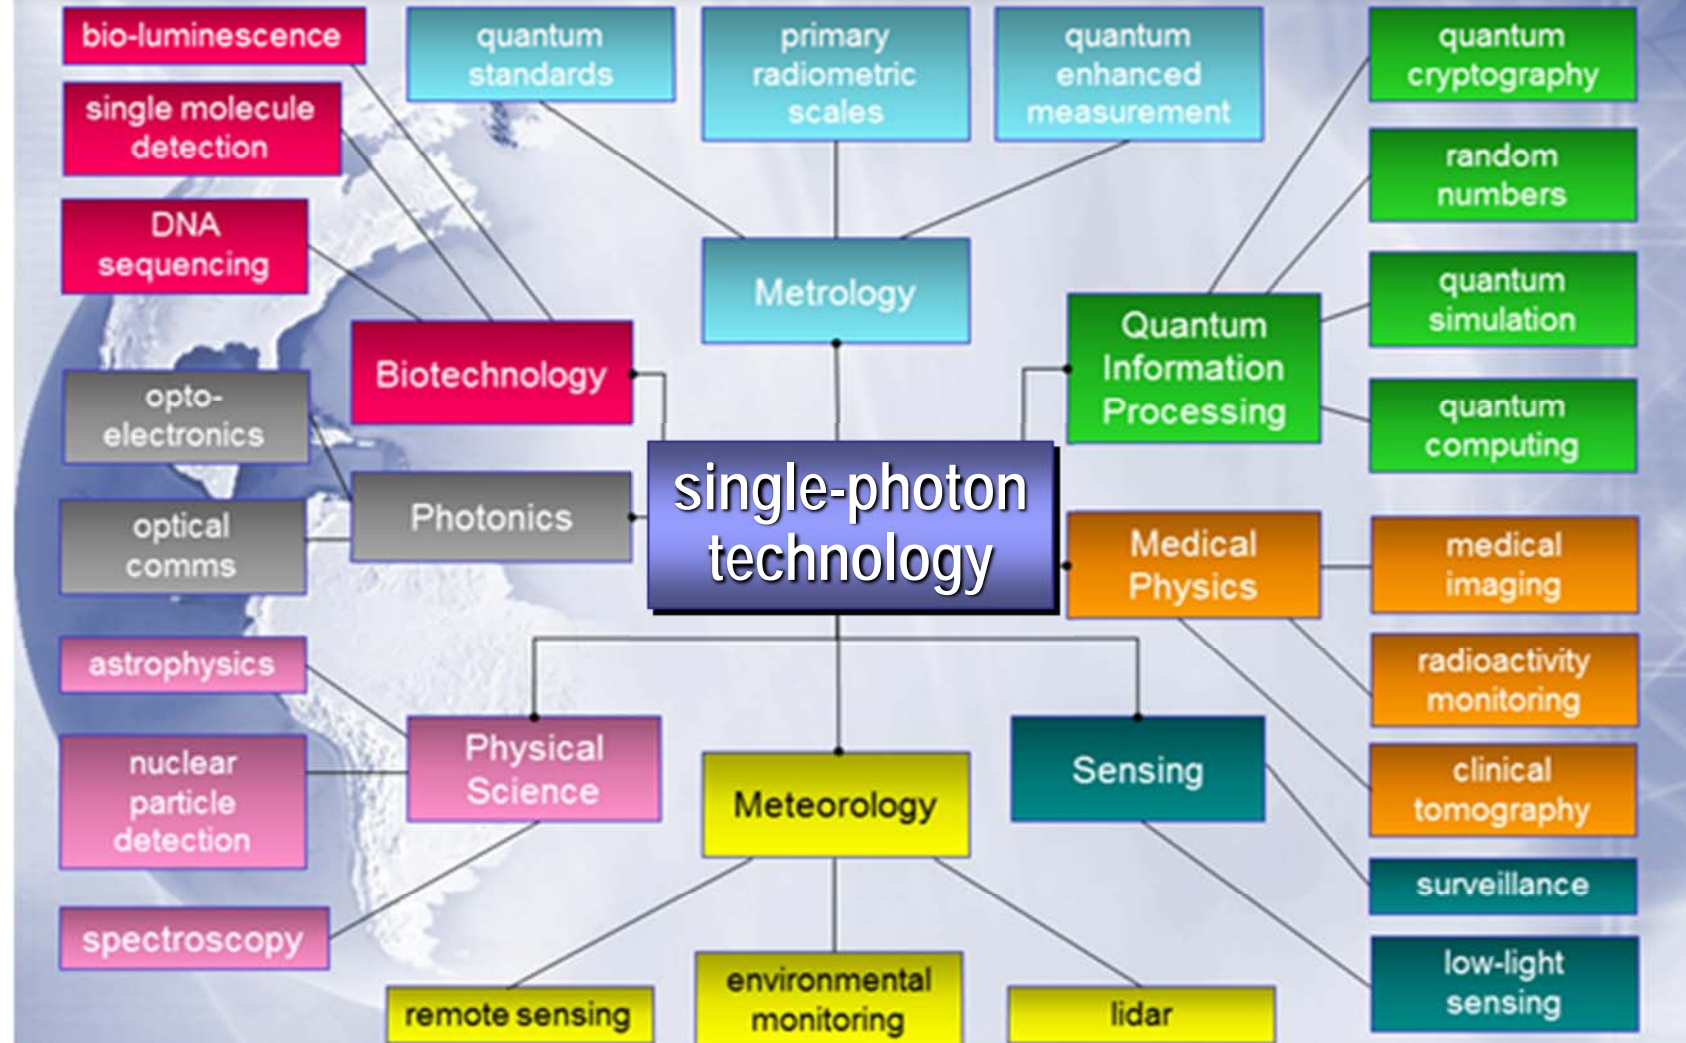

Photon Number Resolving Detectors

discrimination of single and multiple incident photons

Single photon technology

From: Metrology of single-photon sources and detectors: a review

Opt. Eng. 2014;53(8):081910. doi:10.1117/1.OE.53.8.081910

Quantum Radiometry

TARGETS

- Develop suitable metrics for
 - single photon sources
 - photon counting detectors
- Develop methods and measurement facilities for characterising non-classical properties of light:
 - antibunching
 - indistinguishability
 - entanglement
 - quantumness
