I. ABSTRACT

This report describes the results of a pneumatic pressure standards key comparison among eleven SIM National Metrology Institutes to determine their degree of equivalence in the pressure range from 0.6 MPa to 7 MPa in gauge mode. The pilot laboratory was the Centro Nacional de Metrología (CENAM, Mexico). All participating institutes used pneumatic pressure balances as their pressure standard. The transfer standard was a complete system including a pressure balance with a free-deformational piston-cylinder assembly and a set of masses. Eleven participants completed their measurements, although only ten laboratories reported the pressure-dependent effective areas of the transfer standard at specified pressures with the associated uncertainties; NRC/Canada withdrew the comparison by not sending their measurements. To link the results of the ten laboratories that sent their results to the CCM.P-K1.c comparison NIST, USA provided the reference values. To evaluate the compatibility of results of the participants their relative deviations from those obtained by NIST results were analyzed. The results of seven participating NMIs agree with the NIST reference values within their expanded uncertainties (*k*=2) in the entire pressure range from 0.6 MPa to 7 MPa according to the error equation method.

II. INTRODUCTION

This comparison aimed to obtain the equivalence statements into SIM region derived from CCM key Comparison CCM.P-K1.c, in the range from 0.6 MPa to 7 MPa, in pneumatic gauge pressure. This comparison will provide the means to the laboratories to support their uncertainty statements given in their CMC Tables. The number of participants was eleven, three NMI from NORAMET, two from CAMET, one from CARIMET, two from ANDIMET and three from SURAMET. NRC/Canada withdrew the comparison by not sending their measurements. The Pressure and Vacuum Section of the Centro Nacional de Metrología (CENAM), Mexico, was the pilot laboratory in this comparison. The Technical Protocol used specified the procedures followed for the comparison and was prepared in accordance with the Guidelines for CIPM Key Comparisons.

III. COMPARISON PURPOSE

This key regional comparison is to confirm the measurement and calibration capabilities (CMCs) for pneumatic gauge pressure in the range from 0.6 MPa to 7 MPa; also, it allows setting the level of agreement among the participant National Metrology Institutes (NMI) and providing a link to the CIPM Key Comparison CCM.P-K1.c.

IV. PARTICIPATING LABORATORIES

Table 1 shows the list of the participating laboratories with their delivery addresses for the transfer standard (TS), as well as the names of the contact persons.

V. TRANSFER STANDARD AND PARTICIPATING LABORATORIES' STANDARDS USED

The transfer standard was a piston-cylinder assembly of 0.5 cm² nominal effective area with serial number 1150. It is part of a pressure balance equipped with a set of masses; Fluke (DH Instruments), USA, manufactured all parts. This piston-cylinder assembly was considered new since was manufactured in 2008, the pilot laboratory checked during the period of the comparison the drift of its effective area. The TS drift was checked by comparing the results obtained on the calibrations performed by CENAM at the beginning and at the end of the comparison (graph 1 shows the first and last calibrations of the TS made by CENAM, were it can be shown that the TS has no drift). The worst reproducibility calculated for the TS (at 5 300 kPa) was 7.0·10⁻¹¹ m². This uncertainty, due to reproducibility, combined with the area uncertainty was the one used.

The mass pieces to be put on the carrying bell of the TS to generate the nominal pressures are given in the next table (nominal pressure in kPa mass pieces).

Nominal pressure in kPa	Nominal mass pieces in kg
600	(2(1) + 0.5)
700	(2(1)+1)
1 100	(4.5 + 0.5)
1 800	(4.5 + 2(1 to 2))
3 000	(4.5 + 5(1 to 2))
4 100	(4.5 + 5(1 to 3) + 0.5)
5 300	(4.5 + 5(1 to 4) + 1 + 0.5)
6 400	(4.5 + 5(1 to 5 + 2(1)))
7 000	(4.5 + 5(1 to 5) + 2(1 to 2) + 1)

The mass of the mass set pieces is given in Annex 1.

The standards used by the participating laboratories for the calibration of the transfer standard of the comparison are shown in Table 2.

Table 2. Participating laboratories standards used for the comparison.

Traceability	PTB - Germany		PTB - Germany	PTB - Germany	CENAM - Mexico	NIST - USA		CENAM - Mexico	NIST - USA

Note 1: The uncertainty statement for the effective area of the NIST standard combines the uncertainty in A_0 and b. The expanded uncertainty is given by the following, with p in Pa,

$$\frac{U(A)}{A} = \left[\left(\frac{0.34}{p} \right)^2 + (11.6 \times 10^{-6})^2 + \left(2.24 \times 10^{-12} * (p - 830\ 000) \right)^2 \right]$$

Note 2: Canada and Panama did not send the information of the standards used.

VI. MEASUREMENTS PROCEDURE

The measuring method is by cross float between the TS and the standard pressure balance of the participant laboratory. The transfer standard and the piston-cylinder assembly were mounted in accordance with the instructions given in the User's Manual Pressure Balance, Model 7601. The comparison procedure was approved by the participant NMIs as document: SIM Key Comparison for 7 MPa Range of Pneumatic Gauge Pressure - Technical Protocol SIM.P-7.40 (7 MPa).

The most important information is:

- a) The reference temperature of the comparison was 20 °C.
- b) The time between a comparison target pressure level change and the acquisition of data, for the laboratory standard and the TS cross-floating equilibrium, was no less than 10 minutes.
- c) The direction of the piston rotation is clockwise. The rotation, at the equilibrium between the reference standard and TS, should be equal to 20 rpm.
- d) The measurements included three cycles, each with nominal pressures in the following order (600, 700, 1 100, 1 800, 3 000, 4 100, 5 300, 6 400, 7 000, 7 000, 6 400, 5 300, 4 100, 3 000, 1 800, 1 100, 700, 600) kPa. 54 measurements were performed by each laboratory.
- e) Each cycle of measurement was to be completed in one day.
- f) The masses were calibrated, and these values used by all NMIs.
- g) Laboratories used a table with mass identification to generate the nominal pressures.

VII. COMPARISON ROUND

In Table 3 it is presented the delivery date of the TS and the participant laboratory that received the TS.

		laboratories.

VIII. RESULTS

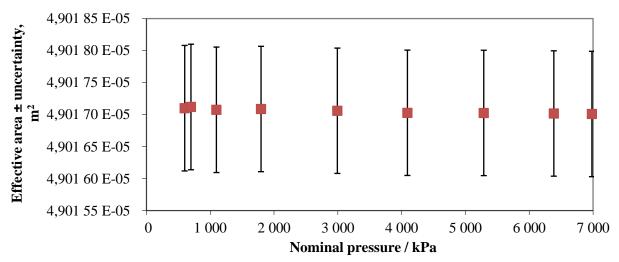

Graph 1 shows the first and last calibrations of the TS made by CENAM. The intermediate checks fall in between these two. The TS showed no drift, as well as no mayor dispersion.

Graph 1. TS effective area and uncertainty as obtained by CENAM, first and last calibrations (at the beginning and at the end of the comparison), m².

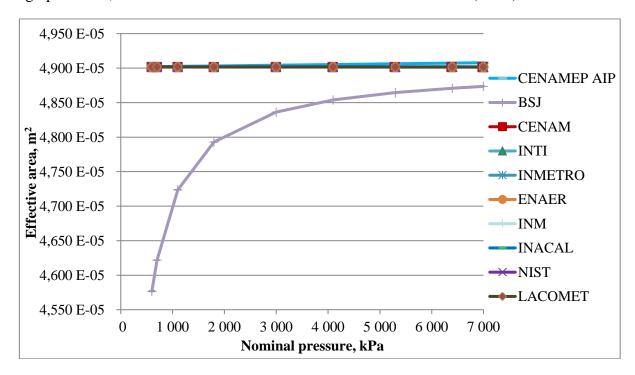

As shown in graph 2, CENAM used for the comparison the last calibration performed.

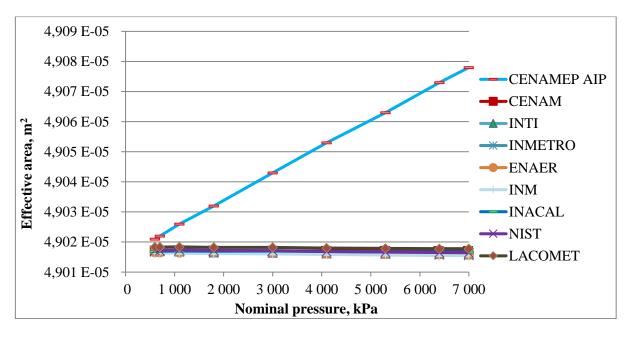

Graph 2. TS effective area and uncertainty used by CENAM, m².

In graphs 3 to 5, the effective area calculated for the TS from each NMI (in m²) are shown.

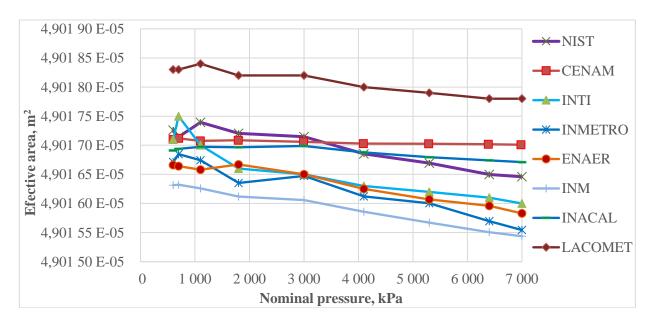

Graph 3. TS effective area as obtained by each NMI, m².

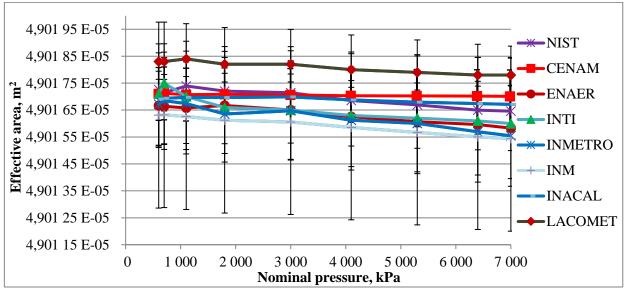

Graph 4. TS effective area and its uncertainty as obtained by each NMI without BSJ, m².

Graph 5. TS effective area as obtained by each NMI without BSJ and CENAMEP AIP, m².

Graph 6 presents the effective area of the TS and its corresponding expanded uncertainty for each NMI, without BSJ and CENAMEP. In tables 4 and 5, the values for effective area and its corresponding uncertainty as obtained by each participating laboratory are included.

Graph 6. TS effective area and its uncertainty as obtained by each NMI without BSJ and CENAMEP, m².

Table 4. TS effective area and its uncertainty as obtained by each NMI, m².

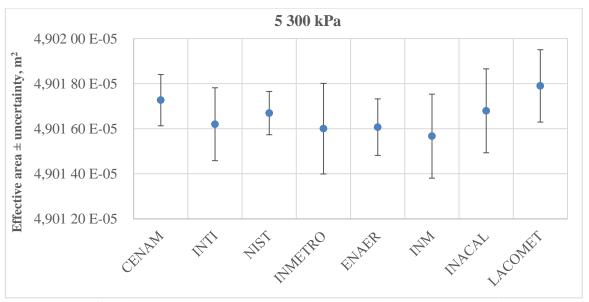

Graph 11. TS effective area and its expanded uncertainty as obtained by each NMI, for 3 000 kPa, m².

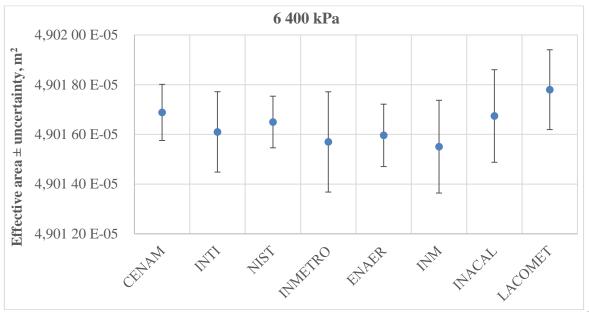

Graph 12. TS effective area and its expanded uncertainty as obtained by each NMI, for 4 100 kPa, m².

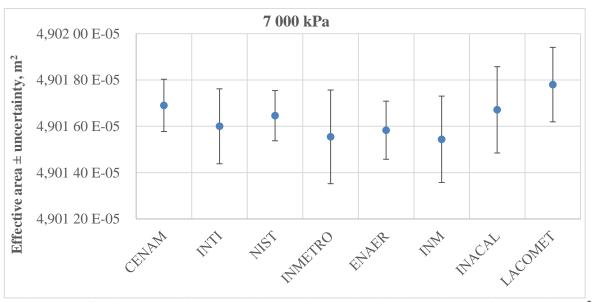

Graph 13. TS effective area and its expanded uncertainty as obtained by each NMI, for 5 300 kPa, m².

Graph 14. TS effective area and its expanded uncertainty as obtained by each NMI, for 6 400 kPa, m².

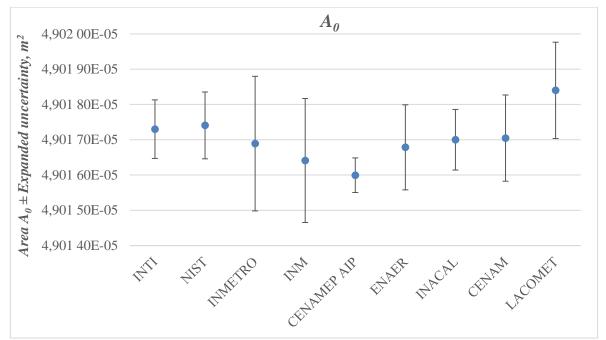

Graph 15. TS effective area and its expanded uncertainty as obtained by each NMI, for 7 000 kPa, m².

Table 6 and graph 16 present the results for A_0 and its corresponding expanded uncertainty for each participating NMI, m². In table 6, laboratories in italics did not calculated A_0 (INMETRO, INM and CENAMEP). To compare results CENAM made the calculations by means of the lineal regression method. To compare the results for the laboratories, a temperature correction was used to transfer their results to 20 °C reference temperature, as outlined in the Comparison Protocol.

IX. EVALUATION OF RESULTS AND CONCLUSIONS

A) SIM

For evaluation of the NMIs performance the normalized error equation (*En*) criteria was applied to their TS effective area results, according to the following equation (1).

$$E_n = \frac{\overline{a} - \overline{A}}{\sqrt{U_{lab}^2 + U_{ref}^2}} \tag{1}$$

Where:

 E_n : Normalized error.

 \overline{a} : Effective area of the TS as obtained by each participating laboratory.

 \overline{A} : Effective area of the TS as obtained by NIST, TS reference area.

 U_{lab}^2 : Expanded uncertainty assigned to the TS effective area as obtained by each participating laboratory.

 U_{ref}^2 : Expanded uncertainty assigned to the TS effective area as obtained by NIST, TS effective area reference uncertainty.

The normalized error equation results have the following criteria:

 $|E_n| \le 1.0$ Satisfactory result.

 $|E_n| > 1.0$ Non-satisfactory result.

Table 7. Normalized error (E_n) according to equation (1), of participating NMIs with respect to the reference laboratory (NIST) values for effective area.

BSJ	-1 902	-1 651	-1 049	-639	-372	-274	-207	-168	-151

In this SIM comparison, 11 laboratories participated. From those, one did not send their measurement results (NRC/Canada). As it can be seen in graphs from 7 to 15 as well as for the normalized error results shown in table 7 and graph 17, from the 10 laboratories which sent their results, seven laboratories have compatibility of their results with those of the references values provided by NIST. Two laboratories (CENAMEP and BSJ) have no compatibility with the reference values or with those results of the other participating laboratories.

Graph 17. Normalized error (E_n) according to equation (1) with respect to the reference laboratory (NIST) values for effective area.

B) SIM.M.P-K1 with CCM.P-K1

For evaluation of the NMIs performance the normalized error equation ($E_{n lab}$) criteria was applied to their TS effective area results, according to the following equation (2).

$$E_{n \ lab} = \frac{\left(X_{lab} - X_{NIST}\right)_{SIM} - (X_{NIST} - X_{VR})_{CIPM}}{\sqrt[2]{U_{lab} SIM}^2 + U_{NIST} SIM}^2 + U_{NIST} CIPM}^2 + U_{VR}^2}$$
(2)

Where,

 $E_{n,lab}$: Normalized error.

 X_{lab} : Effective area of the TS as obtained by each participating laboratory, in SIM.

 x_{NIST} : Effective area of the TS as obtained by NIST, TS reference area in SIM.

 X_{NIST} : Effective area of the TS as obtained by NIST, TS reference area in CIPM.

 x_{VR} : Effective area of the TS as reference area in CIPM.

 $U_{lab SIM}^2$: Expanded uncertainty assigned to the TS effective area as obtained by each

participating laboratory, in SIM.

 $U_{NIST,SIM}^2$: Expanded uncertainty assigned to the TS effective area as obtained by

NIST, TS effective area reference uncertainty in SIM.

 $U_{NISTCIPM}^2$: Expanded uncertainty assigned to the TS effective area as obtained by

NIST, TS effective area reference uncertainty in CIPM.

 U_{VR}^2 : Expanded uncertainty assigned to the TS effective area, TS effective area

reference uncertainty in CIPM.

The normalized error equation results have the following criteria:

 $|E_{n \, lab}| \leq 1.0$ Satisfactory result.

 $|E_{n lab}| > 1.0$ Non-satisfactory result.

To obtain the reference value, all the transfer standard data in the final report of the CCM.P-K1 were fit to the linear function.

 $Ap(20^{\circ}\text{C}, p) = f(p) = Ao(1 + \lambda p)$ where Ao is the effective area at atmospheric pressure and 20 °C and λ is the distortion coefficient.

The resulting value is:

$$Ap / mm^2 = 8.3885165 + 3.94710^{-8} p / kPa$$

which is equivalent to $Ao = 8.388\,516\,5$ mm² and a distortion coefficient $\lambda = 4.71\,10^{-9}$ kPa⁻¹ with a standard deviation of the linear fit of 6.075 10^{-5} mm² equivalent to 7.2 ppm.

In this SIM comparison, 11 laboratories participated. From those, one did not send their measurement results (NRC/Canada). As it can be seen in graphs from 7 to 15 as well as for the normalized error results shown in table 9 and graph 18, from the 10 laboratories which sent their results, seven laboratories have compatibility of their results with those of the references values provided by NIST. Two laboratories (CENAMEP and BSJ) have no compatibility with the reference values or with those results of the other participating laboratories.

Graph 18. Normalized error ($E_{n \, lab}$) according to equation (2) with respect to the reference CIPM values for effective area.

ANNEX 1

Mass values, as calibrated at CENAM.

Mass set

The mass set consists of (all pieces being identified by serial number 2467): Five mass pieces of 5 kg nominal mass, marked by numbers from 1 to 5, One mass piece of 4.5 kg nominal mass,

Two mass pieces of 2 kg marked by numbers from 1 to 2,

One mass piece of 1 kg nominal mass,

One mass piece of 0.5 kg nominal mass,

Two mass pieces of 0.2 kg marked by numbers from 1 to 2 and

The material density of the mass pieces is: $\rho_m = (7.900 \pm 79) \text{ kg/m}^3$

One mass piece of 0.1 kg nominal mass.

The mass of the mass pieces, as calibrated at CENAM, are given in the next table.
