

FINAL – REPORT
COMPARISON OF THE CALIBRATIONS OF HYDROMETERS FOR LIQUID
DENSITY DETERMINATION AMONG SIM LABORATORIES
SIM.M.D-S6

2022-09-26

Luis Omar Becerra, Luis Manuel Peña
Centro Nacional de Metrología, Querétaro México
lbecerra@cenam.mx lpena@cenam.mx

1. Introduction

Hydrometers are instruments widely used for different levels of precision to measure density, specific gravity, alcoholic strength, sugar concentration, etc. of liquids.

In the frame of SIM, it was planned a Supplementary Comparison on the calibration of hydrometers of high accuracy among SIM countries. The aim of this SIM comparison is to check the stated uncertainty levels and degrees of equivalence of NMI laboratories for hydrometer calibrations in the density range between 600 kg m^{-3} and $1\,300 \text{ kg m}^{-3}$ at 20°C and to check liquid density measuring instruments used for this purpose.

The comparison is intended to be a regional supplementary comparison according to the Mutual Recognition Arrangements, and be support to entries for the CMC tables in this sub-field for participant laboratories.

CENAM - Mexico acted as the pilot laboratory in this SIM comparison and NMI – Colombia acted as the co-pilot laboratory.

After starting the comparison, there were received the requests of NIMT – Thailand and SASO – Saudi Arabia, members of APMP and GULFMET correspondingly, to take part in this comparison, requests that were accepted by original participant laboratories.

2. Participant laboratories

The participant laboratories are listed in table 1. NMIs from all SIM sub-regions participated in this comparison.

Table 1. Participants of hydrometer comparison

3 Travelling standards (hydrometer samples)

For this comparison, two set of hydrometers were circulated among participant laboratories in a scheme of two loops.

INM supplied a set of four different hydrometers which were circulated among INM, CENAM, CESMEC, INTI, IBMETRO, INEN, LACOMET and LATU (loop A). Additionally, in order to save time, NIMT supplied a second set of hydrometers with similar characteristics which was circulated and measured by NIMT, SASO, INM and CENAM (loop B). The hydrometers have the following characteristics.

Table 2. Data of the traveling standards for the SIM density comparison.

Characteristic	Hydrometer 1	Hydrometer 2	Hydrometer 3	Hydrometer 4
Manufacturer	Ludwig Schneider	Ludwig Schneider	Ludwig Schneider	Ludwig Schneider
Serial Number (loop A)	14550345	12496642	14550350	15607975 (broken) 15607973
Serial Number (loop B)	17649696	17674015	16648278	15607972
Range	0.600 0 g cm ⁻³ - 0.610 0 g cm ⁻³	0.990 0 g cm ⁻³ - 1.000 0 g cm ⁻³	1.090 0 g cm ⁻³ - 1.100 0 g cm ⁻³	1.290 0 g cm ⁻³ - 1.300 0 g cm ⁻³
Resolution	0.000 1 g cm ⁻³			
Reference Temperature	20 °C	20 °C	20 °C	20 °C

Hydrometer weight (Approx.)	89 g	148 g	161 g	194 g
Hydrometer Length	400 mm	400 mm	400 mm	400 mm

Figure 1. Set of transfer standards (Hydrometers)

4. Nominal values for the hydrometers calibrations

The nominal values including surface tension values for typically used buoyant liquids for the calibration of the hydrometers are listed in table 3.

Table 3. Selected values for the calibration of the hydrometers for the SIM Comparison.

Loop A				
Characteristic	Hydrometer 1	Hydrometer 2	Hydrometer 3	Hydrometer 4
Serial Number	14550345	12496642	14550350	15607975 (broken) 15607973

Surface Tension	15 mN m ⁻¹	35 mN m ⁻¹	35 mN m ⁻¹	35 mN m ⁻¹
Reference Temperature	20 °C	20 °C	20 °C	20 °C
Measuring Points	0.600 0 g cm ⁻³ 0.605 0 g cm ⁻³ 0.610 0 g cm ⁻³	0.990 0 g cm ⁻³ 0.995 0 g cm ⁻³ 1.000 0 g cm ⁻³	1.090 0 g cm ⁻³ 1.095 0 g cm ⁻³ 1.100 0 g cm ⁻³	1.290 0 g cm ⁻³ 1.295 0 g cm ⁻³ 1.300 0 g cm ⁻³

Note: The nominal values selected for the measurements for the first loop were slightly different from those selected for the measurements for the second loop.

5. Circulation and date of measurements

Participants were divided into two loops for the circulation of the travelling standards. Travelling standards were hand-carried among participants according to the schedule in table 4.

Table 4. Dates of measurement of the travelling standards

Participants	Date of Measurements by Participant laboratories
Loop A	
CENAM	2016 November
INM	2017 June
CESMEC	2017 July
INTI *	2017 August
IBMETRO	2017 September
INEN	2017 October
LACOMET	2018 May
CENAM	2018 August
LATU	2018 September
INM	2021 April
Loop B	
NIMT	2019 November
SASO	2020 March
INM	2021 July
CENAM	2021 December

* INTI decided to withdraw from the comparison after making their measurements.

5. Traceability of results reported by participants

For the calibration of the hydrometers, all laboratories used their own hydrostatic weighing system, and all laboratories determined the corrections to the specific indications (at 20 °C) of the travelling standards by Cuckow's method [6].

In table 5 are shown the reference liquids used by participants as density standards for the calibration of the travelling standards, the mean value of the densities and the surface tensions reported by the participants, the sources of traceability reported by participants, and the balance used by participants for the weighing in liquid.

Table 5. Liquids used by participants in their hydrostatic weighing system

Acronym	Liquid	Density Standard	Traceability	Balance used for weighing in liquid
CENAM	Pentadecane Aprox. Density 769 kg m ⁻³ Aprox. Surface tension 27 mN m ⁻¹	Two zerodur spheres approx. mass 1 kg	PTB – Germany	Mettler-Toledo Type AT400 d = 0.1 mg
INM	Nonane Aprox. Density 717 kg m ⁻³ Aprox. Surface tension 23 mN m ⁻¹	Two fused silica cylinders approx. mass 321 g	PTB – Germany	Mettler-Toledo Type XPE404S d = 0.1 mg
CESMEC	Cyclohexane Aprox. Denisty 778 kg m ⁻³ Aprox. Surface tension 35 mN m ⁻¹	Fused silica cylinder approx. mass 220.4 g.	PTB – Germany	Shimadzu Type AUW320 d = 0.1 mg
IBMETRO	Water Aprox. Density 998 kg m ⁻³ Aprox. 72 mN m ⁻¹	N/A	Tanaka´s equation	Mettler-Toledo Type XS 204 d = 0.1 mg
INEN	Water Aprox. Density 998 kg m ⁻³ Aprox. Surface tension 72 mN m ⁻¹	N/A	Tanaka´s equation	Mettler-Toledo Type XP504 d = 0.1 mg
LACOMET	Water Aprox. Density 998 kg m ⁻³ Aprox. Surface tension 72 mN m ⁻¹	N/A	Tanaka´s equation	Sartorius CCE1005 d = 0.01 mg
LATU	n-Tridecane Aprox. Density 756 kg m ⁻³ Aprox. Surface tension 27 mN m ⁻¹	Quartz cylinder approx. mass 217 g	PTB – Germany	Mettler-Toledo Type AG204 d = 0.1 mg
NIMT	n-Tridecane Aprox. Density	Density standard Silicon cylinder	NMIJ – Japan	Mettler-Toledo Type XP504

	756 kg m ⁻³ Aprox Surface tension 24 mN m ⁻¹	approx. mass 220 g		d = 0.1 mg
SASO	n-Tridecane Aprox. Density 756 kg m ⁻³ Aprox Surface tension 26 mN m ⁻¹	Silicon sphere approx. mass 200 g	PTB – Germany	Sartorius MSA524S-100-DA d = 0.1 mg

Note: Certain commercial equipment, instruments, or materials are identified in this report to foster understanding. Such identification does not imply recommendation or endorsement by any of the participating organizations nor does it imply that the materials or equipment identified are necessarily the best available for the purpose.

6. Results as reported by participants

For each hydrometer, the protocol specified three nominal values for which the participants had to report the density corrections and the associated uncertainties at the specific temperature of 20 °C.

CENAM _{B1}	-0.247	0.027	-0.238	0.027	-0.231	0.027

In order to calculate representative results for CENAM and INM, a mean value for each nominal value and the associated uncertainty were calculated as follows,

$$X_{CENAM\ A} = 0.5 X_{CENAM\ A1} + 0.5 X_{CENAM\ A2} \quad (1)$$

$$u(X_{CENAM\ A}) = \left((0.5 u(X_{CENAM\ A1}))^2 + (0.5 u(X_{CENAM\ A2}))^2 + 0.5 u(X_{CENAM\ A1})u(X_{CENAM\ A2}) \right)^{1/2} \quad (2)$$

$$X_{INM\ A} = 0.5 X_{INM\ A1} + 0.5 X_{INM\ A2} \quad (3)$$

$$u(X_{INM\ A}) = \left((0.5 u(X_{INM\ A1}))^2 + (0.5 u(X_{INM\ A2}))^2 + 0.5 u(X_{INM\ A1})u(X_{INM\ A2}) \right)^{1/2} \quad (4)$$

where

$X_{CENAM\ A}$	is the representative value of CENAM for Loop A (for the specific nominal value)
$X_{CENAM\ A1}$	is the first measurement result of CENAM for loop A
$X_{CENAM\ A2}$	is the second measurement result of CENAM for loop A
$X_{INM\ A}$	is the representative value of INM for Loop A (for the specific nominal value)
$X_{INM\ A1}$	is the first measurement result of INM for loop A
$X_{INM\ A2}$	is the second measurement result of INM for loop A
$u(X_{i\ jk})$	is the standard uncertainty associated to the value X of the laboratory “ i ” of the loop “ j ”, and “ k ” means the first or second measurement

The above calculation assumes a fully correlation between the first and the second measurement for each Institute, however, the statistical consistency of CENAM and INM results were checked with the criterion of the normalized error, ($E_n \leq 1$) and there were no found a statistical difference between first and second measurements for both Institutes.

$$E_n(X_{CENAM\ A}) = \frac{|X_{CENAM\ A1} - X_{CENAM\ A2}|}{2\sqrt{u^2(X_{CENAM\ A1}) + u^2(X_{CENAM\ A2})}} \quad (5)$$

$$E_n(X_{INM\ A}) = \frac{|X_{INM\ A1} - X_{INM\ A2}|}{2\sqrt{u^2(X_{INM\ A1}) + u^2(X_{INM\ A2})}} \quad (6)$$

8. Degree of equivalence among participant laboratories

In order to compare results reported by participants among NMIs of loop A, density differences between results reported by participants and results reported by CENAM as well as the associated uncertainties were calculated as follows,

$$d(X_{i\ A}) = X_{i\ A} - X_{CENAM\ A} \quad (7)$$

$$u(d(X_{i\ A})) = (u^2(X_{i\ A}) + u^2(X_{CENAM\ A}))^{1/2} \quad (8)$$

where

$d(X_{i\ A})$	Density difference between the result reported by laboratory “ i ” of loop A and CENAM result for the same loop
$X_{i\ A}$	density correction reported by laboratory “ i ” of loop A
$X_{CENAM\ A}$	Mean correction reported by CENAM for loop A
$u(d(X_{i\ A}))$	standard uncertainty associated to $d(X_{i\ A})$
$u(X_{i\ A})$	standard uncertainty associated to $X_{i\ A}$

As nominal values measured by participants of loop A are slightly different from those measured by participants of loop B (see tables 6 and 7), in order to calculate the corresponding corrections at the same nominal values measured for participants of loop A, a linear function (9) was calculated by hydrometer for all participants of loop B,

$$X_{iB}(\rho_q) = a_i \rho_k + b_i - \varepsilon_i \quad (9)$$

The density differences between participant laboratories and CENAM for loop B, at the same nominal values of loop A (ρ_k), were estimated with the linear functions as follow,

$$d(X_{iB}) = X_{iB} - CENAM_B = (a_{iB} - a_{CENAM_B}) \rho_k - (b_{iB} - b_{CENAM_B}) - \varepsilon_i + \varepsilon_{CENAM_B} \quad (10)$$

The standard uncertainty of the differences calculated by linear approximation were calculated by the following,

$$u(d(X_{iB})) = (u^2(X_{iB}) + u^2(CENAM_B) + u^2(fitt_{iB}) + u^2(fitt_{CENAM_B}))^{1/2} \quad (11)$$

where

$X_{iB}(\rho_q)$	is the representative linear function for laboratory “ <i>i</i> ” of loop B (at the nominal density q)
$CENAM_B$	is the representative linear function for CENAM for the loop B (at the same nominal density)
ρ_k	is the nominal value of density which matches with nominal value (k) selected in loop A
a_i	is the slope of the linear function for laboratory “ <i>i</i> ” of loop B
b_i	is the intercept of the linear function for laboratory “ <i>i</i> ” of loop B
ε_i	is the error of the fitting function for laboratory “ <i>i</i> ” of loop B
a_{CENAM_B}	is the slope of the linear function for CENAM of loop B
b_{CENAM_B}	is the intercept of the linear function for CENAM of loop B
ε_{CENAM_B}	is the error of the fitting function for CENAM of loop B
$d(X_{iB})$	is the density difference between calculated result of laboratory “ <i>i</i> ” of loop B and calculated result of CENAM for the same loop at specific nominal value of density
$u(d(X_{iB}))$	is the standard uncertainty associated to $d(X_{iB})$
$u(fitt_{iB})$	is the standard uncertainty due to the adjusting error of the linear function for laboratory “ <i>i</i> ” of loop B
$u(fitt_{CENAM_B})$	is the standard uncertainty due to the adjusting error of the linear function of CENAM results for loop B

The degree of equivalence between participant laboratory “*i*” and participant laboratory “*j*” from the same loop or from different loop (k), are calculated from the differences of participant laboratories and CENAM as follow,

$$d(X_{ik}, X_{jk}) = d(X_{ik}) - d(X_{jk}) \quad (12)$$

The standard uncertainty of the degree of the equivalence between participant laboratory “*i*” and participant laboratory “*j*”, both from the loop A are calculated as,

$$u(d(X_{iA}, X_{jA})) = \left(u^2(d(X_{iA})) + u^2(d(X_{jA})) - 2u^2(X_{CENAM\ A}) + u^2(X_{CENAM\ REP}) \right)^{\frac{1}{2}} \quad (13)$$

From available differences between $CENAM_{A1}$ and $CENAM_{A2}$ the standard uncertainty due to CENAM reproducibility was estimated as $u(X_{CENAM\ REP}) = 0.005 \text{ kg m}^{-3}$ for the entire range of measurements and from both loops.

The standard uncertainty of the degree of the equivalence between participant laboratory “*i*” and participant laboratory “*j*”, both from the loop B are calculated as,

$$\begin{aligned} u(d(X_{iB}, X_{jB})) &= \left(u^2(d(X_{iB})) + u^2(d(X_{jB})) - 2(u^2(X_{CENAM\ B}) + u^2(fitt_{CENAM\ B})) \right. \\ &\quad \left. + u^2(X_{CENAM\ REP}) \right)^{\frac{1}{2}} \end{aligned} \quad (14)$$

Finally, the standard uncertainty of the degree of the equivalence between participant laboratory “*i*” and participant laboratory “*j*”, both from different loops are calculated as

$$\begin{aligned} u(d(X_{iA}, X_{jB})) &= \left(u^2(d(X_{iA})) + u^2(d(X_{jB})) - u^2(X_{CENAM\ A}) - u^2(X_{CENAM\ B}) - u^2(fitt_{CENAM\ B}) \right. \\ &\quad \left. + u^2(X_{CENAM\ REP}) \right)^{\frac{1}{2}} \end{aligned} \quad (15)$$

In order to check consistency among participant laboratories, the normalized error of the density difference (E_n) were calculated as follow,

$$E_n = \frac{d(X_{ik}, X_{jk})}{U(d(X_{ik}, X_{jk}))} \quad (16)$$

Where $U(d(X_{ik}, X_{jk}))$ is the expanded uncertainty of the density difference,

$$U(d(X_{ik}, X_{jk})) = 2 u(d(X_{ik}, X_{jk})) \quad (17)$$

The criterion for the normalized error is the following:

$E_n \leq 1$ Results are consistent at 95 % of confidence level.

$E_n > 1$ Results are not consistent at 95 % of confidence level.

9. Conclusions

For this comparison nine National Metrology Institutes agreed to take part in a supplementary comparison on the calibration of hydrometers of high accuracy, where seven NMIs are members of SIM, one is a member of APMP and the other is a member of GULFMET.

For this supplementary comparison CENAM – Mexico and NMI - Colombia acted as pilot and copilot laboratories correspondingly.

Nine hydrometers of high accuracy in the range of 600 kg m^{-3} to $1\,300 \text{ kg m}^{-3}$ were circulated among participant laboratories within the period of November 2016 to December 2021. The participant laboratories were divided into two loops, where CENAM and INM took part in both loops.

From measurement results reported by participant laboratories, only one of loop A was completely consistent with measurement results of pilot laboratory and only one of the loop B was completely consistent with pilot laboratory. The other participant laboratory was not completely consistent with pilot laboratory, where at least one normalized error calculated with (6) was greater than 1, see tables 8 to 11 and figures 2 to 13 of Annex A. From 108 density differences calculated among results of participant laboratories and results of pilot laboratory, only the 48 % were consistent.

Density differences, their associated uncertainties and normalized errors between participant laboratories were calculated and the results are listed in tables 12 to 23.

Considering that $|x_i - x_j| = |x_j - x_i|$, from 432 independent density differences calculated among participant laboratories, only 39 % were consistent among them.

There is analysis and work to do within participant laboratories in order to reduce systematic errors and improve measurement results in the calibration of hydrometers of high accuracy.
