

International Science Council

Applying the FAIR principles to the worlds of research and measurement

Simon Hodson Executive Director CODATA www.codata.org

BIPM CGPM 2022 Versailles Convention Centre 17 November 2022

CODATA's mission and operation

- The mission of CODATA is to "Connect data and people to advance science and improve our world".
- As the 'Committee on Data of the International Science Council (ISC)', CODATA supports the ISC's mission of 'advancing science as a global public good' by promoting Open Science and FAIR data.
- CODATA convenes a global expert community and provides a forum for international consensus building and agreements around a range of data science and data policy issues, from the fundamental physical constants to cross-domain data specifications.
- CODATA's membership includes national data committees, scientific academies, International Scientific Unions and other organisations.

Making Data Work...

- Decadal Programme: Making Data Work for Cross Domain Grand Challenges
- Recommendations on core interoperability and FAIR
- FAIR Vocabularies with ISUs
- Cross-Domain Case Studies
- Global Open Science Cloud initiative
- Regional Open Science Platforms

FAIR and Open

- FAIR is an important component of Open Science, but...
 FAIR does not necessarily mean Open
- Drivers for Open: reproducibility and transparency, public benefit.
 - Research data should be as Open as possible and only as closed as necessary; Open by default.
- Drivers for FAIR: maximize the utility, usability of data.
 - Principles of good data stewardship: not enough to put make data Open, dump it raw onto the Web
- FAIR applies as much to data that MUST be restricted as to data that can be Open

The case for Open Science

- Good scientific practice depends on communicating the evidence.
 - Open research data are essential for transparency, scrutiny, reproducibility, self-correction.
 - Boulton, Science as an Open Enterprise: 'to fail to communicate the data that supports scientific assertions is tantamount to malpractice'.
 - Editorial, Miyakawa, T. No raw data, no science: another possible source of the reproducibility crisis. Molecular Brain, 13, 24 (2020). <u>https://doi.org/10.1186/s13041-020-0552-2</u>
 - Increasingly strong position from funders, journal editors, publishers: open data is essential to the conduct of our science.
- Societal and scientific benefit: essential for addressing global and societal challenges.
 - UNESCO Recommendation: strong emphasis on global benefit; benefit for society and involvement of societal actors; very strong ethical dimension.
 - OECD Principles: research data produced by publicly funded research are a public asset.
 - European Commission: essential to accelerate scientific discovery, economic benefits of Open data.
 - Open data practices have transformed certain areas of research: genomics and related biomedical sciences; crystallography; astronomy; areas of earth systems science; various disciplines using remote sensing data...

International Science Council

The case for FAIR (data, metadata, code)

- FAIR: encompasses in an easy communicable acronym, some core principles of good data stewardship
 - Increases the usability and utility of data, metadata, code.
- Emphasis of the benefits of machine-actionability
 - FAIR principles designed to support the use of data at scale, by machines, harnessing technological potential.
 - Vision of harnessing the technologies of the web, to improve querying of vast, dispersed and heterogenous data.
- Increases the value of data for science and the economy
 - PWC report, 2019: Opportunity cost to the European science system of NOT having FAIR data: 8.2 Bn Euros.
 - (at least) 80% of project effort goes into downstream 'data wrangling', rather than upstream 'data stewardship'.

FAIR Guiding Principles

To be Findable:

- F1. (meta)data are assigned a globally unique and persistent identifier
- F2. data are described with rich metadata (defined by R1 below)
- F3. metadata clearly and explicitly include the identifier of the data it describes
- F4. (meta)data are registered or indexed in a searchable resource

To be Accessible:

- A1. (meta)data are retrievable by their identifier using a standardized communications protocol
- A1.1 the protocol is open, free, and universally implementable
- A1.2 the protocol allows for an authentication and authorization procedure, where necessary
- A2. metadata are accessible, even when the data are no longer available

To be Interoperable:

- I1. (meta)data use a formal, accessible, shared, and broadly applicable language for knowledge representation.
- I2. (meta)data use vocabularies that follow FAIR principles
- I3. (meta)data include qualified references to other (meta)data

To be Reusable:

- R1. (meta)data are richly described with a plurality of accurate and relevant attributes
- R1.1. (meta)data are released with a clear and accessible data usage license
- R1.2. (meta)data are associated with detailed provenance
- R1.3. (meta)data meet domain-relevant community standards

(Wilkinson, M., et al., The FAIR Guiding Principles for scientific data management and stewardship, Scientific Data, http://dx.doi.org/10.1038/sdata.2016.18)

European Commission Expert Group, Chaired by Simon Hodson, Turning FAIR into Reality (2018) https://doi.org/10.2777/1524

- **Findable:** have sufficiently rich metadata and a unique and persistent identifier, to enable discovery.
- Accessible: retrievable by humans and machines through a standard protocol; authentication and authorization where necessary.
 - Allows programmatic access for analysis.
- Interoperable: metadata use a 'formal, accessible, shared, and broadly applicable language for knowledge representation'.
 - The descriptions of variables etc follow a shared specification and are commensurable.
- Reusable: metadata provide rich and accurate information; clear usage license; detailed provenance.
 - Both humans and their analytical tools know what can be done with the data (license) and can assess its provenance.

International Science Council

FAIR Digital Objects

- FAIR Digital or Data Object = 'FAIR, machine-interpretable and selfexplanatory units of information'.
- What is the precise identity and location of this object? (PID / GUPRI)
- What may I do with it? (License, protections)
- What can I do with it? (Data type)
- ...
- How can I process it?
 - Concepts, variables and units (Metadata and semantics)
 - Data structure
 - Provenance and processing
 - Quality, accuracy...

FDOs bind all critical data about a digital entity in one object. The data is FAIR: findable, acessible, interoperable and reusable (both by humans and machines).

European City of Science Leiden2022

FAIR Digital Objects: a way of thinking about the information needed for reusability / machine actionability

DIGITAL OBJECT Data, code and other research resources

At its most basic level, data or code is a bitstream or binary sequence. For this to have meaning and to be FAIR, it needs to be represented in standard formats and be accompanied by Persistent Identifiers (PIDs), metadata and documentation. These layers of meaning enrich the object and enable reuse.

IDENTIFIERS

Digital Objects should be assigned a unique and persistent identifier such as a DOI or URN. This enables stable links to the object and supports citation and reuse to be tracked. Identifiers should also be applied to other related concepts such as the data authors (ORCIDs), projects (RAIDs). funders and associated research resources (RRIDs).

STANDARDS & CODE

Digital Objects should be represented in common and ideally open file formats. This enables others to reuse them as the format is in widespread use and software is available to read the files. Open and well-documented formats are easier to preserve. Data also need to be accompanied by the code use to process and analyse the data

METADATA

In order for Digital Objects to be assessable and reusable, they should be accompanied by sufficient metadata and documentation. Basic metadata will enable data discovery, but much richer information and provenance is required to understand how, why, when and by whom the objects were created. To enable the broadest reuse, they should be accompanied by a plurality of relevant attributes and a clear and accessible usage license.

Turning FAIR into Reality https://doi.org/10.2777/1524

What does this mean for measurements and research?

- Joint Statement of Intent on the digital transformation in the international scientific and quality infrastructure: <u>https://www.bipm.org/en/liaison/digital-transformation</u>
- CODATA is a party to the Joint Statement of Intent, along with BIPM, ISC, and other standards and metrology organisations.
- States that "maintaining ... confidence in the accuracy and global comparability of measurement will require the creation and adoption of a fully digital representation of the SI, including robust, unambiguous, and machine-actionable digital representations of units of measurement and of measurement results and uncertainties"

Signing of the Joint Statement of Intent. Clockwise from top left: Wynand Louw, CIPM President (on behalf of the BIPM); Mathieu Denis, ISC Science Director and Acting CEO; Barend Mons, CODATA President; Roman Schwartz, CIML President (on behalf of the OIML); Frank Härtig, IMEKO President.

International Science Council

What does this mean for measurements and research?

- Need for digital (FAIR) representation of units: Digital SI; cooperation and coordination, interoperability / translations with other systems for representing units.
- Need for digital (FAIR) representation of quantities: online referenceable definitions of the measurand / property / variable...
- Research or metrology 'domains' increasingly needing to publish definitions of quantities as 'FAIR semantic artifacts' (ontologies, terminologies, vocabularies.
 - Cox et al., '10 Simple Rules for Making a Vocabulary FAIR' <u>https://doi.org/10.1371/journal.pcbi.1009041</u>
- Some domains have the idea of a 'variable cascade' to assist with machineprocessing / data integration:
 - Conceptual variable: the definition of the variable / quantity.
 - Represented variable: definition, plus meaning and code.
 - Instance variable: instanciation in a given dataset.

Digital SI

https://www.bipm.org/en/conferencecentre/bipm-workshops/digital-si/

DRUM (Digital Representation of Units of Measurement) TG

- Mission: Promote cooperation and coordination across initiatives, and in particular mobilising the input of the various scientific domains, as represented by the ISUs/ISAs: <u>https://codata.org/initiatives/taskgroups/drum/</u>
- Manifesto, endorsed by the ISC and the ISUs/ISAs, calling for greater action and investment on the issue of units of measure (their definition, digital representation and conversion): <u>https://doi.org/10.5281/zenodo.4081656</u>
- Call to Action 'Stop squandering data: make units of measurement machine-readable' Nature Comment Article <u>https://doi.org/10.1038/d41586-022-01233-w</u>
- Sessions at IDW and a Units Summit: <u>https://bit.ly/DRUM-BIPM-Units-Summit</u>

- Contributing to the CIPM WG work on a 'Universal Metrology Data Model' for Units of Measurement.
- Preparing publication of the CODATA Recommended
 Values of the Fundamental Constants as machinereadable Linked Open Data.
- Discussion of expanding the remit of the Task Group to cover definition of quantities

Making Data Work for Cross-Domain Grand Challenges

- ISC Action Plan entrusts CODATA with an initiative 'Making Data Work for Cross-Domain Grand Challenges': establish a global (decadal) programme to address these issues.
- The major, pressing global scientific and human issues of the 21st century can ONLY be addressed through research that works across disciplines to understand complex systems, and which uses interdisciplinary and transdisciplinary approaches to turn data into knowledge and then into action.
- Preparatory Phase: exploring technical issues and case studies through Dagstuhl workshops, TGs and WGs, funded projects etc, to understand the challenges and prepare the programme.
- Core Interoperability Framework: units, vocabularies, data structure, data description...
- **Case Studies:** in a range of domain and cross-domain research areas.
- WorldFAIR Project: takes this approach forward in the context of an EU-funded project.
- Approach extended to Global Open Science Cloud (GOSC) Initiative.

WorldFAIR: Global cooperation on FAIR data policy and practice

- Two year project to advance implementation of the FAIR principles in a range of disciplines, or cross-disciplinary research areas.
- Funded by the European Union, HORIZON-WIDERA-2021-ERA-0 — Project: 101058393
- Two years from 1 June 2022.
- Nineteen partners.
- Institutions in France, Belgium, Cyprus, Denmark, Germany, Ireland, Norway; Australia, Brazil, Kenya, New Zealand, USA; UK.
- Important partnership between CODATA and Research Data Alliance.

WorldFAIR

- Among the most important, but most challenging, recommendations of the Turning FAIR into Reality report, is R.4:
- 'Develop interoperability frameworks for FAIR sharing within disciplines and for interdisciplinary research: Research communities need to be supported to develop interoperability frameworks that define their practices for data sharing, data formats, metadata standards, tools and infrastructure. To support interdisciplinary research, these interoperability frameworks should be articulated in common ways and adopt global standards where relevant.'
- UNESCO Recommendation on Open Science and ISC Action Plan make similar recommendations.
- What is the current practice in metrology? Is there activity to define Open Science and FAIR practices, and an interoperability framework?

WorldFAIR Case Studies

- Chemistry making IUPAC assets FAIR
- Nanomaterials applying NanoInchi and FAIR recommendations in Nanosafety.
- **Geochemistry** recommendations for FAIR in geochemistry, particularly vocabularies.
- Social Surveys Data data harmonisation between ESS and AussiESS.
- Population Health INSPIRE Integration of population surveys with clinical and genomics data for COVID-19 research in eastern and southern Africa.
- Urban Health terminologies and making urban health data FAIR
- Biodiversity improving GBIF data model in collaboration with TDWG - GBIF (Global Biodiversity Information Facility)
- Agricultural Biodiversity pollinator data (KALRO, Embrapa, Meise, HiveTracks)
- Ocean Science Implementing FAIR in the ODIS (Ocean Data and Information System) for the UNESCO Oceans' decade.
- Disaster Risk Reduction recommendations on making DRR data
 and terminologies FAIR, case studies in Africa and Pacific Islands
- Cultural Heritage recommendations on making cultural heritage data FAIR (particularly digital representation of heritage artefacts)

WorldFAIR Coordination and Synthesis

- CODATA leading coordination and synthesis WP.
- **FAIR Implementation Profiles** for each case study (a methodology for understanding FAIR practices).
- Findings will lead into recommendations for **domain sensitive FAIR assessment**.
- Recommendations and documentation for a Cross-Domain Interoperability Framework.

Cross-Domain Interoperability Framework

- FIPs activity prepares WorldFAIR for two 'WP2' outputs: Cross-Domain Interoperability Framework and recommendations for domain sensitive FAIR assessment.
- Exploring features of a Cross-Domain Interoperability Framework with case studies from a range of research areas.
 - Units and quantities/measurands/properties; terminologies/vocabularies/ontologies;
 - Data description/variable cascade, data structure;
 - Provenance and processing; data types; licences; protection and programmatic access...
- A number of webinars / conference sessions: GOSC DataIO Webinar; SciDataCon Session; DCMI Conference.
- Dagstuhl Workshop: discussion paper, report and links at https://worldfairproject.eu/

Where next? CODATA, WorldFAIR and FAIR

- WorldFAIR is a two-year kick start for a set of domain and cross-domain research areas.
- Work of DRUM on digital representation of units of measure, the potential work on FAIR / machine-readable definitions of quantities is very relevant.
- Hope with the Joint Statement of Intent, DRUM, FAIR Vocabularies, FDOs and WorldFAIR to make a significant contribution to FAIR and to the digital transformation in the international scientific and quality infrastructure
