CCT-K2, CCT-K2.1, CCT-K2.3, CCT-K2.4 and CCT-K2.5

Comparison of Capsule-type Standard Platinum Resistance Thermometers (CSPRT)

MEASURAND: Resistance Ratio, W , at nominal temperature

NOMINAL TEMPERATURE: All temperatures

Key comparison CCT-K2

Key comparison reference value: there is no single reference value for this comparison.

Measurement are performed in two separate Groups (Group A and Group B) that are evaluated separately.

Resistance ratios are used with calibration equations for each thermometer to obtain temperature T_i .

For each group, the key comparison reference temperature, T_R , is the weighted average temperature calculated using the experimental variances to set the weights. They have zero uncertainty by definition.

The degree of equivalence of each laboratory with respect to the reference value is given by a pair of terms:

$D_i = (T_i - T_R)$ and U_i , its expanded uncertainty (at 95% confidence level), both expressed in mK.

When required, the degree of equivalence between two laboratories is given by a pair of terms:

$D_{ij} = D_i - D_j = (T_i - T_R) - (T_j - T_R)$ and U_{ij} , its expanded uncertainty (95%), both expressed in mK.

Linking CCT-K2.1, CCT-K2.3, CCT-K2.4 and CCT-K2.5 results to CCT-K2 results

The VNIIFTRI data obtained from CCT-K2.1, the VSL data obtained from CCT-K2.3, the INTiBS and LNE-INM data obtained from CCT-K2.4, and the NMIJ and INRIM data obtained in CCT-K2.5 are linked to CCT-K2 results via NRC, as may be seen on page 4, 5 and 6 of the CCT-K2.1 Final Report, and in Sections 3 of the CCT-K2.3, CCT-K2.4 and CCT-K2.5 Final Reports.

In CCT-K2 Group A and Group B thermometers have been analyzed separately. Degrees of equivalence of linked key comparisons are expressed with respect to the CCT-K2 key comparison reference values for Groups A and B.

No pair-wise degrees of equivalence are reported here.
