CCQM-K19, CCQM-K19.1, and APMP.QM-K19

Key comparison CCQM-K19

MEASURAND : Acidity function at zero chloride molality of an unknown borate buffer

pH ~ 9.17

Measurement temperatures : 15 °C, 25 °C and 37 °C

The key comparison reference value, x_R , is computed as the median of all results, except at 15 °C for which the NCM result is identified as an outlier and thus not taken into account (see Annex B of the CCQM-K19 Final Report).

Its standard uncertainty, u_R , is the standard uncertainty of the median.

Temperature / °C	15	25	37
x_R	9.3222	9.2300	9.1421
$2u_R$	0.0014	0.0013	0.0024

The degree of equivalence of each laboratory i with respect to the reference value is given by a pair of terms:

$D_i = (x_i - x_R)$ and U_i , its expanded uncertainty ($k = 2$), $U_i = 2(u_i^2 + u_R^2)^{1/2}$.

The NCM degree of equivalence is not computed for 15 °C.

The degree of equivalence between two laboratories i and j is given by a pair of terms:

$D_{ij} = D_i - D_j = x_i - x_j$ and U_{ij} , its expanded uncertainty ($k = 2$), $U_{ij} = 2(u_i^2 + u_j^2)^{1/2}$.

No pair-wise degrees of equivalence are explicitly computed here.

Linking key comparison CCQM-K19.1 to key comparison CCQM-K19

The linkage of key comparison CCQM-K19.1 to key comparison CCQM-K19 is explained on page 15 of the CCQM-K19.1 Final Report.

It relies on the common participation of NMIJ, PTB and SMU. Each of these laboratories demonstrated consistent results and uncertainties in both comparisons for the three measurement temperatures.

For each measurement temperature, the degrees of equivalence of participants in CCQM-K19.1 only, relative to the CCQM-K19 key comparison reference value, is given by two terms: D_i and U_i , its expanded uncertainty ($k = 2$), computed according to equations 11 and 12 of the CCQM-K19.1 Final Report.

Linking key comparison APMP.QM-K19 to key comparison CCQM-K19

The results of the participants in APMP.QM-K19 are linked to those of CCQM-K19 through the results of the two linking laboratories, NMIJ and SMU, as explained in Section 8 of the APMP.QM-K19 Final Report.

CCQM-K19, CCQM-K19.1, and APMP.QM-K19

MEASURAND : Acidity function at zero chloride molality of an unknown borate buffer
